Orphaned Objects

- These are not objects lost from a relational database perspective, instead objects without a practical maintainer.

- Legacy and Non-Legacy are not treated equally when you want to keep records up-to-date, for a long time we did not know what to do with legacy.

- We have objects (routing, dns, etc) where an inetnum holder has no ability to maintain them without RIPE NCC intervention.

- This happened because of an ISP change, old locked data, or an inability to accurately reflect how the blocks are used (subnets or sub-allocations).

- inetnum holders should have an ability to maintain their own records.

- How do we enable block holders to keep their db entries accurate?
